space tech

NO RECN'PLAY 2026

RECIFE SPACE TECH: BRINGING RECIFE CLOSER TO THE NEW SPACE ECONOMY

The Arena Go Recife Space Tech is present at Recn'Play 2026 with one purpose: to bring the Space theme closer to the innovation and digital transformation ecosystem that is developing around Porto Digital, one of the main technology environments in Latin America.

The Recife Space Tech revolution comes from a vision of the future: to bring our city closer to the Space Sector, especially to the layer of Space-Based Services. But, after all, what are Space-Based Services? They are digital solutions and services that use data, signals and technologies coming from space systems to solve real problems of humanity.

We are talking about satellite internet, positioning and navigation systems such as GPS, climate monitoring, extreme weather prediction, territorial mapping, urban expansion monitoring, environmental monitoring, precision agriculture and many other applications.

And what is the connection between this universe and the city of Recife? For these services to exist, it is not enough to have satellites in space. We need to transform the data collected by these systems into intelligent information, platforms, software and digital applications capable of solving concrete problems. This is exactly where digital technology plays a fundamental role. Artificial Intelligence, data analytics, software development, cloud computing, geoprocessing and other technologies are essential to transform space data into valuable services for society.

And this is where Recife finds an extraordinary opportunity. Our city is home to Porto Digital, one of the largest technology parks in Latin America, with more than 541 companies and an ecosystem of more than 24,000 digital technology workers.

We have universities, research centers, technology companies, highly qualified professionals and consolidated experience in developing digital solutions. However, we still need to build a structured strategy to connect this potential to the global market of Space-Based Services.

The proposal of Recife Space Tech is precisely to build this connection: to mobilize companies, universities, governments, research institutions and investors to develop a new business, innovation and professional training environment focused on the Space Economy. We are not necessarily talking about building rockets or manufacturing satellites. We are talking about developing, from Recife, the digital technologies that make it possible to transform information coming from space into solutions for cities, companies, governments and people anywhere on the planet.

Our ambition is to position Recife as a global platform for digital transformation focused on Space-Based Services by 2050.

Space is becoming a new frontier of the digital economy. And Recife has the opportunity to participate in this transformation through one of its most consolidated capabilities: the ability to develop technology to solve real problems.

BRINGING THE SPACE SECTOR TO THE EPICENTER OF DIGITAL TRANSFORMATION

The Arena Go Recife Space Tech at Recn'Play 2026 has one main purpose: to bring the Space Sector into the epicenter of one of the largest technology and digital transformation ecosystems in Latin America. But why Recn'Play?

Because we believe that the connection between Recife and the Space Sector needs to start where our city already has consolidated capabilities: technology, innovation, digital transformation, research and human capital. Recn'Play brings together companies, universities, government institutions, entrepreneurs, investors, professionals and young people around technology and innovation. It is exactly this environment that we want to connect with the opportunities emerging from the Space Economy.

Our objective is to bring the Space theme closer to this ecosystem, stimulate new connections, identify opportunities and start building a strategic vision for Recife over the next 25 years. And we are not doing this alone. We have a large network of partners who are contributing with spaces, time, knowledge, institutional participation and, above all, enthusiasm to bring forward a theme that can become extremely relevant to the strategic future of our city.

Our activities will take place across eight different locations: Associação Comercial de Pernambuco (ACP), Tribunal Regional Federal da 5ª Região (TRF-5), Senac 235, Senac Innovation Truck, Torre Malakoff, Marco Zero, Praça do Arsenal and Porto Digital. This distributed format is also part of our strategy: to take the Space theme beyond a single location and connect different environments, institutions and audiences across the city.

The program includes debate panels, conversation sessions, workshops, an ideathon, immersive activities with a planetarium and exhibitions. Among the partners bringing activities to the program, we will have Polí-UPE, UFRPE, Coreto, FORAP, Estácio, Grau Educacional and Sociedade Astronômica de Recife. We will also have representatives from a broad institutional and professional ecosystem participating in our debates, discussions and activities, including the OAB-PE Space Law Commission, the Latin American Association of Space Law (ALADA), the Labor Prosecutor's Office (MPT), the Regional Labor Court (TRT), the Ministry of Labor, the Pernambuco Professional Apprenticeship Forum, UFRPE, Polí-UPE, Estácio, UFPE, UNICAP, IFPE, SENAI, Parquetec, Parqtel, Porto Digital, Recife's Department of Education, Recife Operations Center (COP), Recife's Secretariat for Digital Transformation, Science and Technology, FBR, Associação Comercial de Pernambuco and Oeste Inovador.

We will also have a special program curated by Porto Digital in partnership with Recife Space Tech, called "Space Starts Here", featuring representatives from NASA and the U.S. Department of State. This is an important opportunity to bring international perspectives into our local ecosystem and expand the dialogue with organizations and institutions connected to the global Space Sector.
But we want to make one thing clear: Arena Go Recife Space Tech is not just an event. It is the beginning of a strategic process.

The program designed for 2026 is our starting point. Our intention is to expand its activities, bring new partners into the ecosystem, increase the diversity of perspectives and develop new connections over the coming years.

Our vision is to establish Recife Space Tech as an annual presence in the Recn'Play program, creating a continuous environment for dialogue, knowledge exchange, ecosystem development and new business opportunities.

We want this conversation to evolve year after year, bringing together the capabilities of our three technology parks, Digital Technology, Deep Tech and Industrial Innovation, with universities, research centers, companies, public institutions and international organizations. The idea is to connect these capabilities, generate synergies and transform this collective potential into practical projects, new services, qualified jobs and real impact on our territory.

Looking ahead to 2050, our ambition is to position Recife as a global platform for digital transformation focused on the Space Sector, especially in the Space-Based Services layer. And this is where our journey begins: bringing the Space Sector closer to Recife, connecting our capabilities and building, together, a new vision of the future. Space starts here. And the future is something we build together.

PANEL DISCUSSION

LET'S BUILD A CONVERSATION ABOUT RECIFE AND THE FUTURE OF SPACE

Although what makes our city immediately qualified to start a process of connection with the Space Sector is our capacity in digital technologies and digital transformation, our city has other capabilities that can be developed to make this process more systemic and powerful.

We have three technology parks: one focused on digital technology, another on Deep Tech, and the third on industrial innovation. We also have a very important ecosystem of universities, public institutions and research centers.

And, of course, we have human capital that can be stimulated to understand the meaning and the opportunities of connecting Recife to the Space Sector. For example, our young people. They are entering the professional market and starting to perform today, but they will also help us build this vision of the future.

In this context, we have designed a program for Arena Go Recife Space Tech, where the main connection of our conversations is the relationship between Space and our city. However, we want to explore this connection from different perspectives, bringing different debates that can help us understand the variables involved in this process.For example, we will have a debate about Space Law and Space Diplomacy, connecting our discussion to important factors such as autonomy, sovereignty and legal security in the Space Sector.

We will also bring a discussion involving young people, technology and the future, because we need to understand how the new generations can participate in this transformation and contribute to the city's performance.

Additionally, we will have a panel focused on discussing the three technology parks and the overall performance of the city. This discussion will help us understand how these three environments can connect and operate as a strategic playing field, where the necessary connections and synergies can happen, and where practical projects and initiatives can generate real impact on our territory.

The idea is to understand how these different capabilities can work together, creating a systemic environment for innovation, business development and new opportunities.

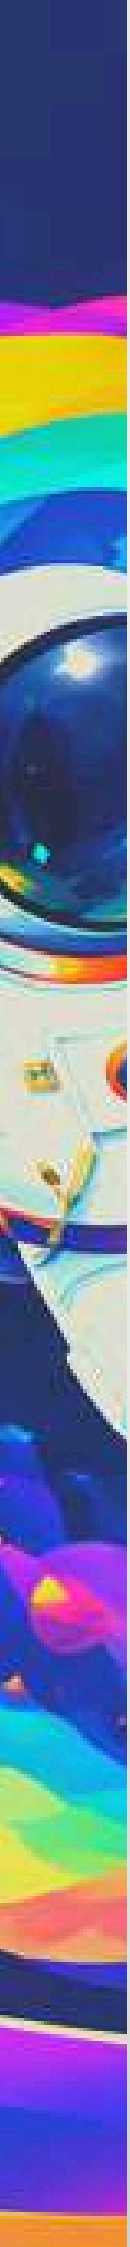

Next, we are going to present each of the conversations we will have, so you can already understand how revolutionary this vision of the future can be: positioning Recife as a global protagonist in digital transformation focused on the Space Sector, especially in the Space-Based Services layer.

So, fasten your seat belts, and let's take off!

PANEL DISCUSSION 1: THE YOUNG APPRENTICESHIP LAW AND THE ROLE OF RECIFE'S YOUTH IN THE DIGITAL AND SPACE ECONOMY TRANSFORMATION

In this panel discussion, we will explore three variables: young people, technology, and the future of urban performance including connections to the space sector through space-based services.

ARENA GO RECIFE SPACE TECH NO RECN'PLAY 2026

YOUNG PEOPLE: THE PROFESSIONALS OF TODAY AND THE LEADERS OF TOMORROW

The future of a city depends not only on its technological infrastructure, economic investments or institutional capabilities. It also depends on its ability to develop, connect and empower its people.

Young people are not simply the professionals of the future. They are already part of today's workforce, contributing to businesses, institutions, innovation environments and the development of our cities.

In a context of rapid technological transformation, the challenge is to create opportunities for young people to participate in new economic activities, develop relevant competencies and contribute directly to improving the performance of their territories.

Digital technologies, artificial intelligence, software development, data intelligence and the emerging space economy are transforming professional opportunities and creating new demands for skills, knowledge and adaptability.

We need to prepare young people not only for the jobs that already exist, but also for the new professions, markets and opportunities that are being created.

THE YOUNG APPRENTICESHIP LAW AS AN INSTRUMENT FOR PROFESSIONAL DEVELOPMENT

In this context, the Brazilian Young Apprenticeship Law represents an important instrument for connecting education, professional development and access to the labor market.

By promoting the integration between theoretical learning and practical professional experience, professional apprenticeship creates opportunities for young people to develop competencies, gain experience and establish their first connections with the productive sector.

Institutions such as the Ministry of Labor and Employment, the Public Labor Prosecutor's Office, the Regional Labor Court and the Pernambuco Professional Apprenticeship Forum play relevant roles in promoting, supervising, articulating and strengthening professional apprenticeship policies.

The challenge is to recognize apprenticeship not simply as a legal obligation for companies, but as a strategic mechanism for talent development, social inclusion and economic productivity.

It can help businesses identify new talent, develop professional competencies and create stronger connections with the next generation of workers.

More than providing the first professional opportunity, apprenticeship can become an entry point into emerging technological and economic sectors.

CONNECTING YOUNG PEOPLE TO THE DIGITAL AND SPACE ECONOMIES

As Recife advances its digital transformation agenda and develops its vision as a future platform for space-based services, we need to consider how young people can become active participants in this process.

The development of the digital economy and the downstream space sector will create opportunities in areas such as software engineering, artificial intelligence, data analytics, satellite applications, geospatial intelligence, cybersecurity, electronics, automation and digital services.

These opportunities should not be restricted to highly specialized professionals or people who already have access to advanced technological education.

We need to create pathways that connect young people from different social and educational backgrounds to these emerging markets.

Professional apprenticeship can help establish these pathways, connecting companies, educational institutions, public policies and innovation ecosystems.

The objective is to bring young people closer to the real challenges of the city, allowing them to participate in projects, develop practical competencies and contribute to solutions that improve urban services, economic performance and quality of life.

FROM PROFESSIONAL INCLUSION TO ACTIVE PARTICIPATION IN THE CITY'S FUTURE

Recife has the opportunity to develop a new perspective on professional apprenticeship.

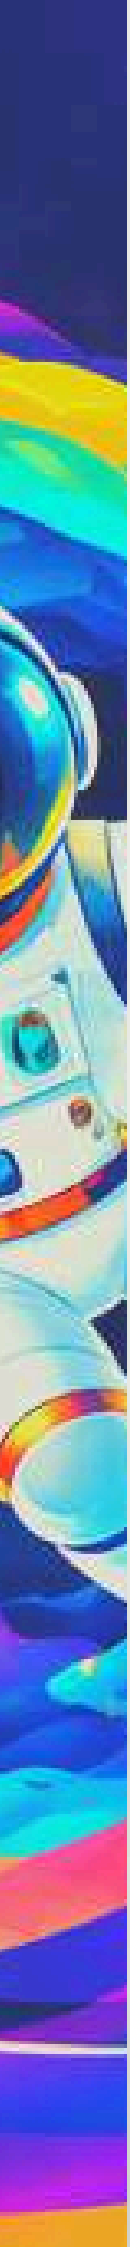

Instead of looking at young people only as beneficiaries of employment policies, we should recognize them as strategic contributors to the city's transformation.

Their participation can help accelerate innovation, expand technological adoption, improve organizational performance and bring new perspectives to public and private institutions.

This requires stronger connections between government, companies, universities, technical schools, labor institutions and innovation ecosystems.

It also requires a continuous effort to identify emerging professional demands and adapt training opportunities to the technological and economic transformations taking place.

The question is not only how to prepare young people for the future of work, but how to give them the opportunity to actively participate in building that future.

LOOKING AHEAD: YOUNG PEOPLE AS PART OF RECIFE'S 2050 VISION

If Recife wants to become a relevant platform for digital transformation and space-based services, it must also develop the human capabilities required to sustain this ambition.

The young people entering the labor market today will be part of the professionals, entrepreneurs, researchers, engineers, developers and leaders who will shape the city's technological and economic future.

Connecting professional apprenticeship to digital transformation, innovation and the emerging space economy can help create new opportunities for inclusion, productivity and social mobility.

This is an opportunity to connect the development of people with the development of the territory.

THE CENTRAL QUESTION

How can the Young Apprenticeship Law, together with the articulation between labor institutions, companies, educational institutions and innovation ecosystems, create new pathways for Recife's youth to develop professional competencies, participate in the digital and space economies, and actively contribute to the city's transformation and performance?

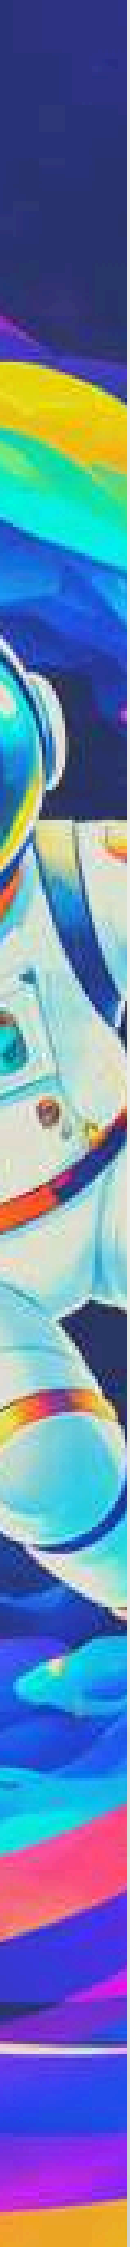

Our challenge is to move from professional inclusion to active participation, from training opportunities to real capabilities, and from preparing young people for the future to building the future together with them.

The young people of Recife are not just the future of the city. They are part of its present transformation.

PANEL DISCUSSION 2: URBAN RESILIENCE, DIGITAL TECHNOLOGY, SATELLITE DATA AND CONNECTIVITY IN URBAN MANAGEMENT

In this panel, we examine practical applications that contribute to delivering solutions for humanity, creating the conditions to enhance urban management.

ARENA GO RECIFE SPACE TECH NO RECN'PLAY 2026

THE NEW CHALLENGES OF URBAN MANAGEMENT

Cities are facing increasingly complex challenges. Climate change, extreme weather events, population growth, infrastructure pressure, mobility, environmental degradation and social vulnerabilities are demanding new approaches to urban management.

Traditional management models, often based on fragmented information, reactive decisions and limited integration between institutions, are no longer sufficient to address the complexity and dynamics of contemporary urban environments.

In this context, digital transformation becomes a strategic capability for cities. The integration of digital technologies, artificial intelligence, connectivity, geospatial intelligence and real-time data creates new possibilities for understanding urban dynamics, anticipating risks and improving public decision-making. The challenge is to move from reactive urban management towards a more integrated, predictive and intelligent approach.

SATELLITE DATA AND DIGITAL INTELLIGENCE FOR URBAN RESILIENCE

Space-based technologies offer important opportunities to improve how cities monitor, understand and manage their territories. Satellite imagery, remote sensing, geospatial data and positioning technologies can provide valuable information about urban expansion, environmental changes, land use, water resources, infrastructure conditions and climate-related risks.

When integrated with artificial intelligence, data analytics, connectivity and municipal information systems, these resources can generate predictive intelligence and support more effective public policies.

This integration can contribute to disaster prevention, climate adaptation, environmental monitoring, infrastructure planning, mobility management and civil defense operations.

The opportunity is not simply to have access to more data, but to transform data into actionable intelligence, connecting information to decisions, decisions to public policies, and public policies to concrete results for citizens.

CONNECTING TECHNOLOGY, DATA AND URBAN GOVERNANCE

However, technology alone does not transform urban management. We need to develop institutional capabilities, integrate different databases, connect public agencies, establish collaborative partnerships and create governance models that allow information to circulate and generate value.

Connectivity is also a fundamental component of this process. It enables the integration of sensors, devices, platforms, satellite information and operational systems, creating a more connected and intelligent urban environment.

Cities need to develop the capacity to orchestrate these different resources and transform them into integrated solutions.

This requires collaboration between government, universities, research institutions, technology companies, startups and the space sector.

LOOKING AHEAD: THE FUTURE OF RESILIENT AND INTELLIGENT CITIES

Cover the next decades, the convergence between digital transformation and space-based services can redefine how cities anticipate challenges, manage risks and develop their territories.

For Recife, this represents an opportunity to connect its existing capabilities in digital transformation, technology, software development, public-sector innovation and ecosystem orchestration with new applications of satellite data and space-based intelligence.

The objective is to develop new solutions that strengthen urban resilience, improve the quality of public services and increase the capacity of government to anticipate and respond to complex urban challenges.

We need to think about how to build cities that are not only more connected and digital, but also more intelligent, predictive, adaptive and resilient.

THE CENTRAL QUESTION

How can we integrate satellite data, digital technologies, artificial intelligence and connectivity into urban management to develop more predictive, intelligent and resilient cities, while transforming territorial capabilities into new solutions and opportunities for the future?

The challenge is to connect space-based information with real urban needs, transforming technological capabilities into better decisions, more effective public policies and greater resilience for our cities.

PANEL DISCUSSION 3: THE URGENCY OF SPACE LAW AND SPACE DIPLOMACY IN BRAZIL

The intention of this panel is to discuss what space law is, its current status, and the urgency of this discussion in Brazil, taking into account variables such as autonomy and sovereignty.

ARENA GO RECIFE SPACE TECH NO RECN'PLAY 2026

PANEL DISCUSSION 3

SPACE IS ALSO A MATTER OF LAW, GOVERNANCE AND SOVEREIGNTY

The development of the global space sector is not only a technological and economic transformation. It is also a legal, institutional, diplomatic and geopolitical challenge.

As space activities expand, new questions emerge regarding the use of space resources, satellite operations, data governance, telecommunications, orbital traffic, environmental sustainability, liability, security and international cooperation.

These developments require legal frameworks, institutional arrangements and international agreements capable of establishing principles, responsibilities and conditions for the sustainable and equitable development of space activities.

Space is becoming an increasingly strategic environment. And where governance mechanisms are insufficient, power asymmetries can become even more significant.

The absence of effective rules and balanced institutional arrangements creates the risk that decisions will be predominantly shaped by those with greater technological, economic and political capabilities.

WHY COUNTRIES LIKE BRAZIL NEED TO ADVANCE THIS DEBATE

Countries that are not yet central players in the global space industry have particular reasons to engage in the development of international space governance.

For Brazil, this discussion involves more than following international developments or adapting to rules established by other countries.

It is about participating in the construction of the legal and institutional frameworks that will influence the future of the global space sector.

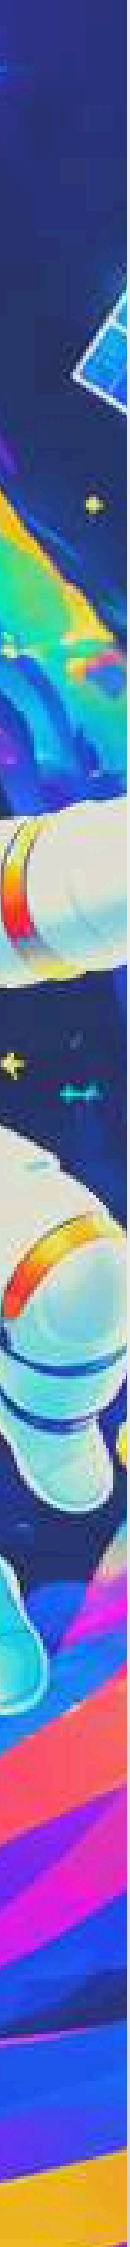

As the largest country in Latin America, Brazil has relevant territorial, scientific, technological, economic and institutional interests connected to space activities.

The country needs to strengthen its legal expertise, develop specialized professionals, expand academic research, promote institutional cooperation and increase its participation in international discussions.

This is particularly important as new technologies and business models emerge, creating questions that involve national interests, international responsibilities, commercial activities and the future governance of space.

Space diplomacy is therefore a strategic instrument for connecting national interests with international cooperation and multilateral governance.

The objective is not simply to participate in the space economy, but also to contribute to the definition of the principles and rules that will govern its development.

RECIFE: CONNECTING LAW, ACADEMIA, TECHNOLOGY AND INTERNATIONAL DIALOGUE

Within the Recife Space Tech vision, we understand that developing a territorial ecosystem for space-based services requires more than technological and industrial capabilities.

It also requires legal knowledge, institutional capacity, international relations and a deeper understanding of the governance challenges associated with the space sector. This creates an important opportunity for Recife.

By connecting the academic capabilities of institutions such as UFPE, UNICAP and IFPE, the work of the Brazilian Bar Association (OAB), specialized legal professionals and international organizations such as the Latin American Association of Space Law, Recife can help establish a permanent environment for discussion, research and cooperation in space law and diplomacy.

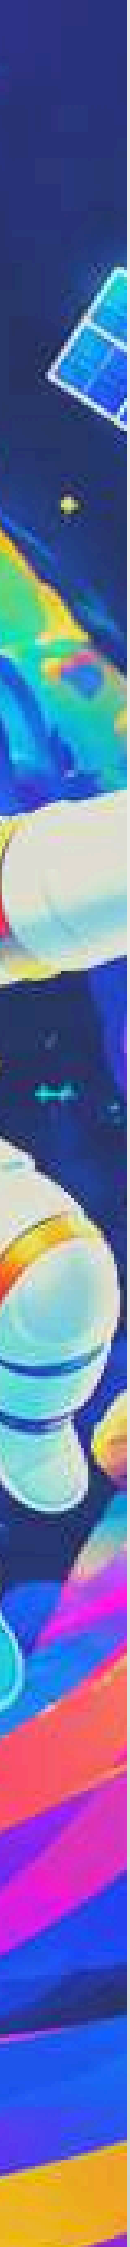

The objective is to bring this debate closer to universities, legal professionals, public institutions, technology companies and society.

We need to stimulate academic production, develop specialized knowledge, connect Brazilian and Latin American institutions and create opportunities for new generations of professionals to participate in this emerging field.

This initiative can begin at the local level, expand nationally and contribute to a broader Latin American dialogue.

FROM LOCAL DIALOGUE TO BRAZILIAN AND LATIN AMERICAN PARTICIPATION

Recife has the opportunity to use the Recife Space Tech initiative as a platform to stimulate this discussion and connect different institutional and academic actors.
The ambition is to contribute to the development of a stronger Brazilian presence in space law and diplomacy, while promoting cooperation across Latin America.
This requires a multidisciplinary approach, bringing together law, international relations, technology, economics, public policy and the space industry.
It also requires a long-term perspective.
The rules being discussed and developed today will influence the conditions under which future generations of countries, companies and institutions will participate in the space economy.
For Brazil and Latin America, participating in this process is essential to strengthening institutional capacity, protecting legitimate interests and contributing to a more balanced and cooperative international space governance framework.

THE CENTRAL QUESTION

How can Brazil, as the largest country in Latin America, strengthen its participation in the development of international space law and diplomacy, building legal, academic and institutional capabilities to protect its interests and contribute to the governance of the future global space economy?

And, from Recife's perspective: How can we transform Recife into a local platform for academic production, institutional cooperation and international dialogue on space law and diplomacy, creating a movement that can reverberate throughout Brazil and Latin America?

Our challenge is to understand that the future of the space sector will not be defined exclusively by those who develop the technology, build the infrastructure or operate satellites.

It will also be shaped by those who participate in defining its rules, establishing its governance mechanisms and building the international agreements that will guide its development.

We cannot leave the construction of the future rules of the space economy exclusively in the hands of those who already concentrate the greatest space capabilities.

We need to participate in this debate, develop our own expertise and contribute to shaping the future of space governance.
The time to build this capacity is now.

PANEL DISCUSSION 4: DIGITAL TRANSFORMATION, DEEP TECH AND INDUSTRIAL INNOVATION AS STRATEGIC CAPABILITIES OF RECIFE: A SYSTEMIC VISION FOR THE FUTURE

The intention of this panel is to discuss the capabilities of the city of Recife. While our proficiency in digital transformation is what immediately qualifies us to engage with the space sector as a key player, we also possess expertise in deep tech and industrial innovation. The framework formed by these three technology parks can enhance our region's capacity to connect with the space sector, specifically within the realm of space-based services.

RECIFE: THREE TECHNOLOGICAL DIMENSIONS, ONE STRATEGIC VISION

Recife has been developing a diversified technological ecosystem, with relevant capabilities in digital transformation, scientific research, deep technologies and industrial innovation.
One of the city's most important strategic assets is the presence of three complementary technological environments, each with specific competencies and development potential.

The Porto Digital, one of Latin America's leading technology and innovation ecosystems, represents Recife's strong capabilities in software development, digital transformation, artificial intelligence, data intelligence, connectivity and digital services.

The Parquetec represents an important dimension of the city's emerging Deep Tech capabilities, connecting universities, research centers, scientific knowledge, technological development and innovation based on advanced technologies.

The Parqtel adds another fundamental dimension: industrial innovation, electronics, electrical engineering, automation and the development of technological solutions connected to industrial applications.

These three environments represent different but complementary dimensions of technological development.

Digital Transformation, Deep Tech and Industrial Innovation. The strategic opportunity is to connect these capabilities through a systemic vision, transforming different technological competencies into an integrated platform for innovation, industrial development and global competitiveness.

CONNECTING RECIFE'S CAPABILITIES TO THE SPACE SECTOR

The global space sector is becoming increasingly multidisciplinary. Its development requires much more than traditional space engineering and infrastructure.

It increasingly depends on software, artificial intelligence, advanced data processing, electronics, automation, hardware, scientific research, engineering and the integration of complex technological systems. This creates a direct connection with the capabilities already present in Recife.

The Porto Digital can contribute with software, artificial intelligence, satellite data processing, digital platforms and the development of space-based services.The Parquetec can contribute with scientific research, Deep Tech development, advanced technological solutions, applied research and the connection between academia and industry. The Parqtel can contribute with electronics, automation, industrial engineering, hardware development and technological integration.

Together, these competencies can address different technological challenges and opportunities across the space value chain, from advanced technological development to downstream applications and services.

This is an important distinction: Recife does not need to reproduce the traditional structure of an established space industrial center to become a relevant player in the global space economy.

We can develop a complementary position, connecting digital capabilities, scientific knowledge and industrial innovation to the demands of the space sector.

PANEL DISCUSSION 4

FROM THREE TECHNOLOGICAL ENVIRONMENTS TO ONE INTEGRATED ECOSYSTEM

The central challenge is to move beyond the individual development of each technological environment and establish stronger connections between them.

We need to create synergies, stimulate collaborative projects, connect companies with research institutions, promote technology transfer, develop specialized talent and attract investments. This requires ecosystem orchestration, institutional cooperation and a shared strategic vision.

Rather than considering the three parks as independent assets, we should recognize them as complementary components of a broader territorial innovation system.

Their integration can generate new technological combinations, accelerate innovation, strengthen the local industrial base and create opportunities for companies to participate in national and international value chains.

A SYSTEMIC VISION TOWARDS 2050

Looking towards 2050, Recife has the opportunity to position itself as a strategic territory where digital transformation, Deep Tech and industrial innovation converge to address complex technological challenges.

The connection with the space sector represents an important opportunity to accelerate this process, creating new markets, developing specialized businesses, attracting international partnerships and expanding Brazil's participation in the global space economy.

The objective is not simply to connect three technological parks to a new industry. It is to connect their capabilities, develop new synergies and establish a long-term innovation platform capable of generating technological, industrial and economic value. Recife already has important assets. The next step is to orchestrate these assets around a common strategic purpose.

THE CENTRAL QUESTION

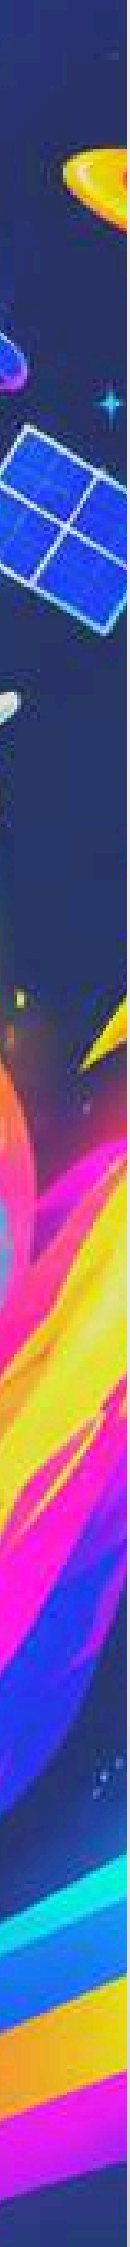

How can Recife integrate its three major technological dimensions (Digital Transformation, Deep Tech and Industrial Innovation) into a systemic innovation ecosystem capable of addressing the challenges of the space sector, accelerating technological development and positioning the city as a strategic player in the global space economy?

Our opportunity is to connect what we already have, integrate what we are developing and build what we want to become.

Three technological environments. Complementary capabilities. One integrated vision for the future.

PANEL DISCUSSION 5: CHALLENGES, PERSPECTIVES AND OPPORTUNITIES FOR THE NEXT 25 YEARS AT THE INTERSECTION OF DIGITAL TRANSFORMATION, DEEP TECH AND SPACE-BASED SERVICES

In this panel, we want to explore the connections and opportunities between Recife's digital transformation ecosystem, including its capabilities in Deep Tech and industrial innovation, and the Space Sector.
Our goal is to understand how these different capabilities can connect, generate synergies and create new opportunities for the city, looking ahead to the future in next 25 years.

LOOKING AT THE FUTURE: CHALLENGES AND OPPORTUNITIES

The next 25 years will bring significant transformations to the global economy, driven by the convergence of digital technologies, artificial intelligence, data intelligence, advanced software and space-based infrastructure.

The space sector is evolving rapidly, and the downstream segment is opening new opportunities for the development of digital services, innovative business models and applications across multiple economic sectors.

However, this transformation also brings important challenges. How can we transform the increasing availability of satellite data and space-based resources into practical solutions, scalable services and economic value? How can we develop the technological, institutional and human capabilities required to participate in this emerging global market? And how can territories position themselves strategically within this new economic landscape?

These questions become particularly relevant when we look at the next decades and consider the role that cities and regional innovation ecosystems can play in this transformation.

CONNECTING TERRITORIAL CAPABILITIES TO A NEW GLOBAL MARKET

Recife has been developing relevant capabilities in digital transformation, technology, software engineering, data intelligence, innovation and ecosystem development.

Our challenge is to understand how these existing capabilities can connect with the requirements and opportunities of the downstream space economy. We need to look beyond the traditional boundaries of the space industry and recognize that the development of space-based services depends on the integration of different competencies, institutions, technologies and economic sectors.

This creates an opportunity to connect our universities, research institutions, technology companies, startups, government organizations and international partners around a common strategic purpose.

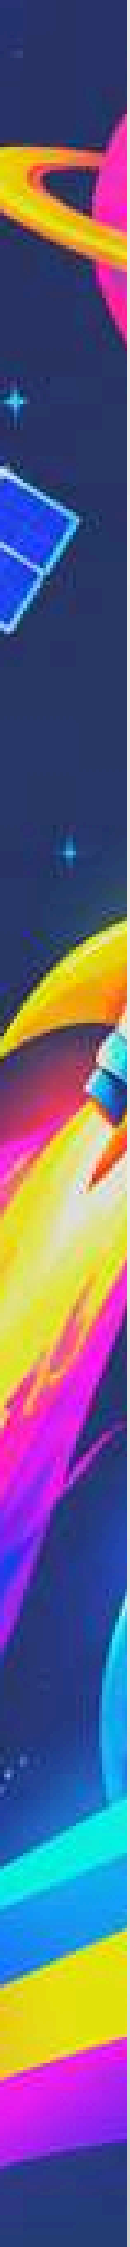

The question is not simply how Recife can participate in the space sector, but how we can organize our territorial capabilities to become relevant contributors to its future development.

A 25-YEAR PERSPECTIVE: FROM CAPABILITIES TO GLOBAL LEADERSHIP

Looking towards 2050, we need to think strategically about the capabilities we must develop today to create a competitive position in the global market tomorrow.

What technological capabilities will be essential? What types of professionals, research structures and business models will be required? What institutional arrangements and international partnerships should we establish? And how can we create an environment that attracts companies, investments, talent and new opportunities?

We also need to consider how Recife can move from its current experience in digital transformation towards a more integrated position in the global value chain of space-based services.

This requires a continuous process of learning, collaboration, investment and ecosystem orchestration.
Our ambition is not simply to follow the development of this market, but to actively contribute to shaping its future.

THE CENTRAL QUESTION

How can Recife transform its existing territorial capabilities in digital transformation into a strategic competitive advantage, connecting institutions, talent, technology and international markets to become a global reference platform for space-based services over the next 25 years?

This is an invitation to look at the future, identify the challenges, explore the opportunities and, above all, understand what we need to start building together today.

Because global positioning is not something we create at the end of the journey. It is the result of the connections, decisions, capabilities and partnerships we develop now.

PANEL DISCUSSION 6: THE ROLE OF TERRITORIAL ECOSYSTEMS IN DIGITAL TECHNOLOGIES TO ADDRESS THE CHALLENGES OF THE SPACE SECTOR

The idea behind this panel is to foster a discussion that directly links digital transformation, a key performance area for the city of Recife, with the challenges where it could contribute to the space sector.

THE SPACE SECTOR NEEDS MORE THAN SPACE INFRASTRUCTURE

The global space sector is facing increasingly complex technological, economic and institutional challenges. The development of new space capabilities requires not only investments in satellites, launch systems and infrastructure, but also advanced digital technologies, qualified professionals, research capabilities and innovative business models.

Artificial intelligence, software engineering, data analytics, cybersecurity, connectivity and advanced computing are becoming increasingly important to the competitiveness and evolution of the space industry.

This creates an important opportunity to expand the participation of territories with strong digital capabilities in the global space value chain.

The challenge is to recognize that many of the solutions required by the space sector can emerge from innovation ecosystems that have developed expertise in digital technologies, even when their traditional industrial base is not directly connected to space activities.

TERRITORIAL ECOSYSTEMS AS STRATEGIC ASSETS

Territories such as Recife have developed relevant capabilities in software development, digital transformation, artificial intelligence, data intelligence, technological innovation and entrepreneurship.

These capabilities represent strategic assets that can be connected to the technological demands of the space sector.

The opportunity is to bring together universities, research institutions, technology companies, startups, government organizations and international partners to develop solutions for real challenges in the space industry.

Territorial ecosystems can contribute by accelerating innovation, developing specialized software, processing satellite data, creating artificial intelligence applications, improving operational efficiency and developing new downstream services.

More than simply providing technology, these ecosystems can create collaborative environments where different competencies are integrated to generate innovation, new businesses and economic value.

FROM TERRITORIAL CAPABILITIES TO NATIONAL COMPETITIVENESS

This discussion is particularly relevant for Brazil. To increase our competitiveness in the global space sector, we need to expand our technological capabilities, strengthen our innovation ecosystems, develop specialized talent and create stronger connections between the space industry and the broader digital economy.

We also need to connect different regions, institutions and areas of expertise, recognizing that the development of a competitive national space ecosystem does not depend exclusively on traditional space-industry centers.

PANEL DISCUSSION 6

Territories with strong digital capabilities can complement existing national competencies, contribute to technological development, accelerate the creation of new solutions and expand Brazil's participation in the global downstream space economy.

In this context, Recife can play a strategic role by connecting its technology ecosystem to national space-sector challenges and international market opportunities.

The objective is not to compete with existing capabilities in other Brazilian territories, but to create complementarities, establish partnerships and expand the collective capacity of the country.

BUILDING THE CONNECTIONS FOR THE FUTURE

The central challenge is how to transform existing territorial capabilities into concrete contributions to the space sector.

What technological challenges can be addressed through digital innovation? How can we connect universities, companies, startups and research institutions to develop solutions? What mechanisms can accelerate technology transfer, entrepreneurship and investment? How can we establish stronger connections between regional ecosystems and national space programs?

These questions require a collaborative and strategic approach, based on ecosystem orchestration, institutional cooperation and a long-term vision.

THE CENTRAL QUESTION

How can territorial innovation ecosystems with strong digital technology capabilities, such as Recife, contribute to addressing the technological and business challenges of the space sector, strengthening Brazil's national capabilities and increasing its competitiveness in the global space economy?

Our opportunity is to connect what we already know how to do with what the space sector needs to develop.

The challenge is to transform distributed territorial capabilities into integrated national capacity, creating new connections, new solutions and new opportunities for Brazil to become more competitive in the global space economy.

CONVERSATION CIRCLE

YOUTH, EDUCATION, TECHNOLOGY, AND THE FUTURE OF THE CITY

At Arena Go Recife Space Tech, hosted at the headquarters of the Pernambuco Commercial Association (ACP), we will have a program of conversation sessions curated by partners such as Polí-UPE, the Pernambuco Professional Apprenticeship Forum, Grau Técnico, and Faculdade Estácio.

The sessions will bring participants together around three central variables: youth, technology, and the future performance of the city. The objective is to stimulate students to reflect on their role in transforming Recife, developing new capabilities, and contributing to the city's economic development and competitiveness.

Each institution will bring a complementary perspective to this discussion.
Polí-UPE will lead a conversation about Education, Technology, and the Future, exploring how educational methods and technologies are changing and how these transformations may impact the next generations.

The Pernambuco Professional Apprenticeship Forum will articulate the institutions that are part of its network, organizing conversation sessions over two days to stimulate young people's future vision, professional perspectives, and understanding of the opportunities ahead.

Faculdade Estácio, through its Technology and Computer Science coordination, will bring discussions about how technology is transforming society and the labor market, and why young people need to adapt to this new context.
Grau Técnico will focus on technological professional qualification, discussing how young people can prepare for future opportunities while also participating actively in building that future.

Together, these five conversation sessions aim to connect different institutional perspectives and generate a broader understanding of the transformations underway.

The central idea is not simply to talk about the future, but to encourage young people to understand their role in building it, connecting their capabilities with technology, new professional opportunities, and the future development of Recife.

CONVERSATION CIRCLE

YOUTH, TECHNOLOGY, AND THE FUTURE OF THE CITY

Four conversation sessions bringing together young people and educational institutions to explore how technology, new professions, and changes in the labor market will shape Recife's future. The objective is to stimulate critical thinking about the role of youth in the city's development, competitiveness, and connection with emerging sectors, including the Space Economy.

ARENA GO RECIFE SPACE TECH NO RECN'PLAY 2026

YOUTH, TECHNOLOGY, AND THE FUTURE OF THE CITY

The purpose of the four conversation sessions, organized on different days by the Pernambuco Professional Apprenticeship Forum, Grau Educacional, and Faculdade Estácio, is to stimulate young people to reflect on their role in building the future of Recife.

The conversations will explore the variables that connect youth, education, professional qualification, technology, and the labor market. The idea is to discuss both the technologies already available and those that will arrive, transforming professions, work models, and the way we create value.

More than presenting trends, the objective is to stimulate reflection: How can young people actively participate in the city's future vision? How can their capabilities, choices, and professional development contribute to Recife's productivity, competitiveness, and overall performance?

This discussion also creates an opportunity to connect young people with emerging economic sectors, such as the Space Sector, initially through Recife's most developed capability: digital transformation. After all, the Space Economy increasingly depends on skills in software, data, artificial intelligence, engineering, and digital services.

The proposal is to connect the city's future vision with the perspectives of young people, helping them understand the transformations underway and recognize their potential as professionals, citizens, and active participants in building the future of Recife.

CONVERSATION CIRCLE

YOUTH, TECHNOLOGY, AND THE FUTURE OF THE CITY

Led by Polí-UPE, this conversation explores how cultural, social, and technological transformations will shape the future of education. It will discuss emerging methods, concepts, and technologies, connecting new educational possibilities with the Space Sector and its potential applications in research, learning, and knowledge development.

ARENA GO RECIFE SPACE TECH NO RECN'PLAY 2026

THE FUTURE OF EDUCATION AND THE TECHNOLOGIES OF THE FUTURE

Led by Polí-UPE, this conversation aims to explore the future of education in a context of continuous cultural, technological, and social transformation.

The discussion will bring together methods, concepts, and emerging technologies that may change how people learn, how educational institutions operate, and how knowledge is developed and shared. The objective is to understand which technologies are already transforming education and which future innovations may redefine its possibilities.

An important perspective is to connect this discussion with the Space Sector. Space technologies, satellite systems, Earth observation, geospatial data, and artificial intelligence are creating new opportunities for research, learning, and educational applications.

This connection allows us to expand the vision of education beyond traditional boundaries, bringing universities, students, researchers, and professionals closer to new scientific and technological frontiers.

The central purpose is to stimulate a forward-looking discussion about how education can anticipate transformations, connect with emerging technologies, and prepare people to participate in the opportunities of the future, including those generated by the Space Economy.

11/11/26, 13 h
AUDITORIUM SENAC 235

WORKSHOP: Demoday Inova Polí/ UPE - Predictive Inteligence to Urban Management and others challengers

12/11/26, 9 h
ACP, ROOM 2, 1º FLOOR

WORKSHOP: “O Pilar do Futuro Recife” with CORETO Team

13/11/26, 13 h
SENAC INNOVATION TRUCK

WORKSHOP: Interactive CubeSat workshop, assemble and control a satellite live with Polí-UPE team

14/11/26, 10 h
ACP, ROOM 2, 1º FLOOR

WORKSHOP: Drone workshop with the Delta team

WORKSHOP INDEX

WORKSHOP

CONNECTING KNOWLEDGE, TECHNOLOGY, AND PRACTICAL EXPERIENCE

At Arena Go Recife Space Tech, we will have four practical workshops designed to bring participants closer to technologies, experiences, and applications connected to the Space Sector and the future of our cities.

Through the activities led by Polí-UPE and its partners, participants will have the opportunity to go beyond theoretical concepts, exploring equipment, interacting with technologies, and experiencing practical simulations involving satellites, drones, and their potential applications.

Coreto, Secti Recife, will lead the Ideathon “O Pilar do Futuro Recife”, creating an open innovation experience to listen to and understand the community's perspective on the main challenges faced by residents of Pilar. The objective is to identify their needs, understand the barriers to economic and social development, and collectively explore ideas and possible solutions from the citizens' own perspectives. The proposal is to transform community insights into practical project opportunities, connecting residents with institutions and organizations that can contribute to real solutions and generate a positive impact on the territory.

The workshops will also stimulate curiosity about scientific knowledge, technological innovation, and emerging business opportunities, demonstrating how different capabilities can be transformed into practical solutions for real challenges.

The objective is to connect knowledge with experience, technology with real applications, and participants with new possibilities for education, professional development, innovation, and the Space Economy.

WORKSHOP 1

DEMODAY INOVA POLÍ/ UPE - PREDICTIVE INTELIGENCE TO URBAN MANAGEMENT AND OTHERS CHALLENGERS

Inova Polí-UPE connects academic talent and organizations through open innovation. Recife Space Tech proposed a challenge focused on using satellite data and predictive intelligence to improve urban management, monitor risks, and support preventive actions. At Demoday, students will present their solutions, transforming research and technology into practical urban applications.

ARENA GO RECIFE SPACE TECH NO RECN'PLAY 2026

WORKSHOP 1

INOVA POLÍ-UPE: FROM INNOVATION TO REAL URBAN SOLUTIONS

In October, UPE held Inova Polí, an open innovation initiative that invited undergraduate and graduate students to develop projects and propose solutions to different challenges presented by organizations.

Recife Space Tech brought a challenge directly connected to the Space Sector, focusing on the use of satellite data for urban management through predictive intelligence. The proposal is to transform space-based data into indicators that allow the municipality to monitor risks, anticipate scenarios, and better manage prevention and response actions.

During the Demoday, students will present the projects they have developed to the organizations that proposed the challenges.
This initiative demonstrates how we can connect universities, students, organizations, and the Space Sector, transforming scientific knowledge and technological capabilities into practical solutions for real urban challenges.

WORKSHOP 2
“O PILAR DO FUTURO RECIFE” WITH CORETO TEAM

An open innovation initiative that puts citizens at the center of community development. Through the Ideathon, residents of Pilar will identify economic challenges, propose solutions, and present projects to public institutions, companies, and social organizations, building partnerships to generate real opportunities, improve local economic performance, and create a replicable inclusion model.

ARENA GO RECIFE SPACE TECH NO RECN'PLAY 2026

WORKSHOP 2

“O PILAR DO FUTURO RECIFE” WITH CORETO TEAM

The development of a city needs to reach its communities, creating conditions for people to improve their economic performance and take advantage of new opportunities.

In this context, the Ideathon “O Pilar do Futuro Recife” proposes an open innovation process built with the citizens themselves. The objective is to listen to and understand their perspectives, identifying the main challenges they face in generating income, starting a business, accessing professional opportunities, and entering the labor market.

We also want to understand how citizens believe government, companies, institutions, and society can contribute to improving their capabilities and expanding their economic opportunities.

Representatives from SENAC, ACP, Recife's Department of Education, FORAP, Grau Educacional, and SECTI Recife will participate in this initiative, connecting different institutional perspectives with the real demands of the community.

At the end of the process, residents will present projects developed from their own experiences and ideas to these organizations. The purpose is to bring the community's perspective closer to institutions and attract partners willing to transform these proposals into real actions with a direct impact on people's lives.

Our objective is to build a practical model of community inclusion, based on citizen participation, institutional collaboration, and real economic opportunities, with the potential to be replicated in other territories across Recife.

WORKSHOP 3

INTERACTIVE CUBESAT WORKSHOP, ASSEMBLE AND CONTROL A SATELLITE LIVE WITH POLÍ-UPE TEAM

Polí-UPE will offer an immersive, hands-on workshop where participants can explore satellite assembly and control through practical simulations. The activity connects people with real Space Technology applications, stimulating curiosity, technical interest, and engagement with the scientific and technological capabilities that make space missions possible.

ARENA GO RECIFE SPACE TECH NO RECN'PLAY 2026

WORKSHOP 3

A PRACTICAL AND IMMERSIVE EXPERIENCE WITH SPACE TECHNOLOGY

To bring real applications of the Space Sector closer to the public, Polí-UPE will bring a practical workshop to Arena Go Recife Space Tech at Recn'Play.

Participants will have the opportunity to see, interact with, and learn how to operate satellite systems through simulations of satellite assembly and control.

The objective is to create an immersive experience, connecting theoretical knowledge with practical interaction. By allowing participants to explore how satellites are assembled and controlled, the activity aims to stimulate curiosity, develop interest in Space Technology, and bring people closer to the scientific and technological capabilities involved in space missions.

The idea is to make Space Technology more accessible, transforming curiosity into practical experience and stimulating new interests, knowledge, and opportunities for the future.

WORKSHOP 4
DRONE WORKSHOP WITH THE DELTA TEAM POLÍ-UPE

Polí-UPE and the Delta Team will offer a practical drone workshop, presenting equipment and allowing participants to operate drones and explore their real-world applications. The activity connects technology, innovation, and new business opportunities, demonstrating how drones can contribute to urban services, city management, and territorial development.

ARENA GO RECIFE SPACE TECH NO RECN'PLAY 2026

WORKSHOP 4

DRONE WORKSHOP WITH THE POLÍ-UPE DELTA TEAM

The use of drones in urban environments has become an important business opportunity and a strategic capability for cities. Their applications are expanding across different sectors, while legislation, regulatory frameworks, and public policies to stimulate their use are increasingly part of the current discussion in Brazil.

In this context, Polí-UPE, together with the Delta Team, will offer a practical workshop to stimulate participants' interest in this technology.

During the activity, different equipment will be presented and operated, giving participants the opportunity to have direct experience with how drones work and explore their potential applications in urban environments.

The objective is to connect technology, practical experience, and new perspectives, demonstrating how drones can contribute to urban services, business development, innovation, and the performance of cities.
The proposal is to bring participants closer to this emerging technology, connecting practical knowledge with real opportunities for the future of our cities.

11 à 14/11/26, 10 h
TORRE MALAKOFF

EXPERIENCES: “Desvendando o ceú astral” team of UFRPE

13 À 14/11/26, 10 h
ACP, HALL

EXPERIENCE: inflatable planetarium with SAR - “Sociedade Astrônomica de Recife”

IMMERSIVE EXPERIENCE

BRINGING YOUNG PEOPLE CLOSER TO ASTRONOMY

Arena Go Recife Space Tech will feature immersive experiences designed to bring young people closer to Astronomy, creating opportunities to explore the Universe through interactive, educational, and engaging activities.

UFRPE, through its extension project “Desvendando o Céu Astral”, will bring a diverse program of activities to Torre Malakoff, connecting participants with astronomical observation, scientific knowledge, and playful learning experiences.

The Astronomical Society of Recife (SAR) will be at the Pernambuco Commercial Association (ACP), with an inflatable planetarium and an exhibition featuring images and information about the Universe, offering participants an immersive experience to discover Astronomy and explore the depths of space.

The objective is to stimulate scientific curiosity, make Astronomy more accessible, and connect new generations with Science, Technology, and the possibilities of the Space Sector.

IMMERSIVE EXPERIENCE 1

“DESVENDANDO O CEÚ ASTRAL” TEAM OF UFRPE

Through its “Desvendando o Céu Astral” project, UFRPE will offer immersive Astronomy experiences at Torre Malakoff, including telescope observations, rocket workshops, thematic talks, theater, and astronomical tourism. The initiative connects young people with scientific knowledge, stimulates curiosity, and strengthens Recife's educational and institutional capabilities in Astronomy and Space Science.

CONNECTING YOUNG PEOPLE, SCIENCE, AND THE UNIVERSE

The Federal Rural University of Pernambuco (UFRPE), through its extension project “Desvendando o Céu Astral”, will bring a series of immersive and interactive activities to Torre Malakoff, with the purpose of bringing young people closer to Astronomy and Space Science through practical, educational, and playful experiences.

The program will include:

- Astronomical Observation: using telescopes, solar observation masks, and mobile applications.
- Educational Rocket Workshop: hands-on activities involving rocket assembly and launch.
- Thematic Talks: discussions about Astronomy and Space Science.
- Astronomy Theater: theatrical representations of important episodes and personalities in the history of Astronomy.
- Astronomical Tourism: guided experiences through the observatory of Jorge Marcgrave, patron of Astronomy in Pernambuco, and Torre Malakoff, historically connected to Dom Pedro II, patron of Astronomy in Brazil.

UFRPE has been leading the development of Astronomy education and the promotion of this scientific field in Recife, especially through its Department of Physics. The university already offers a specialization in Astronomy, focused on preparing teachers to introduce astronomical concepts into elementary and secondary education, stimulating scientific curiosity among children and young people.

Looking ahead, the university is also preparing the first professional master's degree in Astronomy in Pernambuco, expected to start in 2027, through its Department of Physics.

The objective is to connect education, scientific knowledge, and public engagement, transforming Astronomy into an accessible and inspiring experience for young people, while strengthening Recife's connection with Science and the broader Space Sector.

IMMERSIVE EXPERIENCE 2

INFLATABLE PLANETARIUM WITH SAR - “SOCIEDADE ASTRÔNOMICA DE RECIFE”

Polí-UPE and the Delta Team will offer a practical drone workshop, presenting equipment and allowing participants to operate drones and explore their real-world applications. The activity connects technology, innovation, and new business opportunities, demonstrating how drones can contribute to urban services, city management, and territorial development.

EXPLORING THE UNIVERSE: AN IMMERSIVE ASTRONOMY EXPERIENCE WITH SAR

The Astronomical Society of Recife will be part of Arena Go Recife Space Tech at Recn'Play 2026, bringing an immersive experience that allows young people to explore and discover the depths of the Universe.

At the ACP Hall, an inflatable planetarium will provide participants with an opportunity to experience the Universe in an interactive and engaging environment. The activity will also include an exhibition featuring images and interesting facts about the Universe, creating new opportunities to explore Astronomy, understand celestial phenomena, and stimulate scientific curiosity.

For more than four decades, the Astronomical Society of Recife has been promoting Astronomy in the city through educational and public engagement activities, including telescope observations that allow children and young people to learn about the sky through playful and interactive experiences.

The objective is to make Astronomy more accessible, transform scientific knowledge into an immersive experience, and stimulate the interest of new generations in Science, Technology, and the Space Sector.
